

Automating Business Processes using Deluge Scripting and Workflows, with Application Testing and Debugging

Mini Experiment Report

Presented by: Divoshini V

Roll No: 241401020

Objective

- To automate a real-world business process (Vehicle Service Request Management) using Zoho Creator.
- To implement business logic using Deluge scripting for validations and notifications.
- To design workflows that trigger automatically on form submission.
- To test and debug the application to ensure reliable, error-free execution.

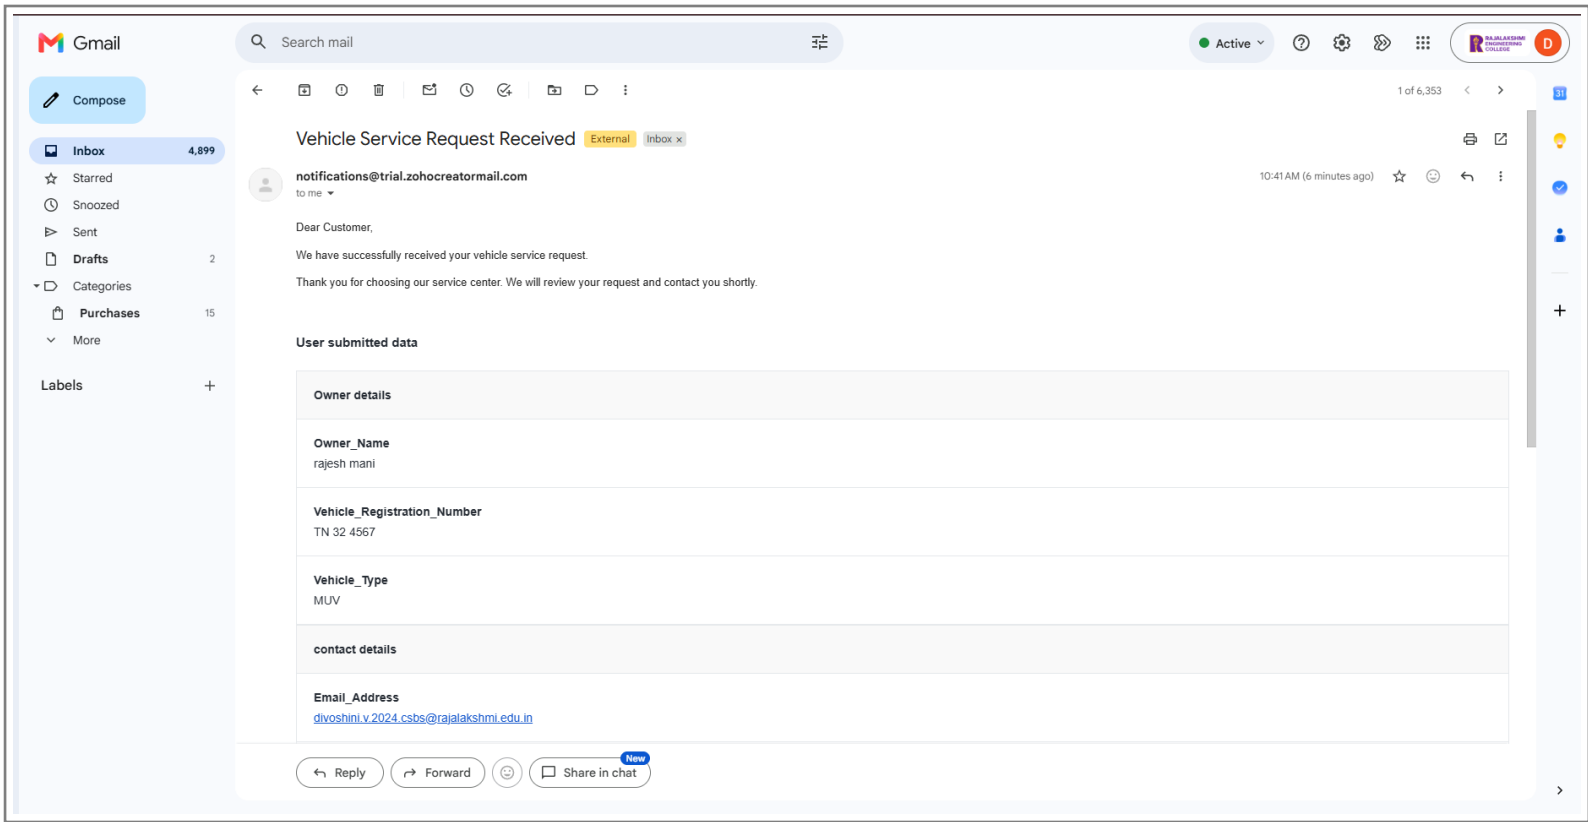

Tools and Technologies Used

- Zoho Creator - Low-code application development platform.
- Deluge Scripting Language - For writing business logic and validation rules.
- Zoho Creator Workflows - For automating actions on form events.
- Gmail - For receiving automated email notifications.

Implementation Overview

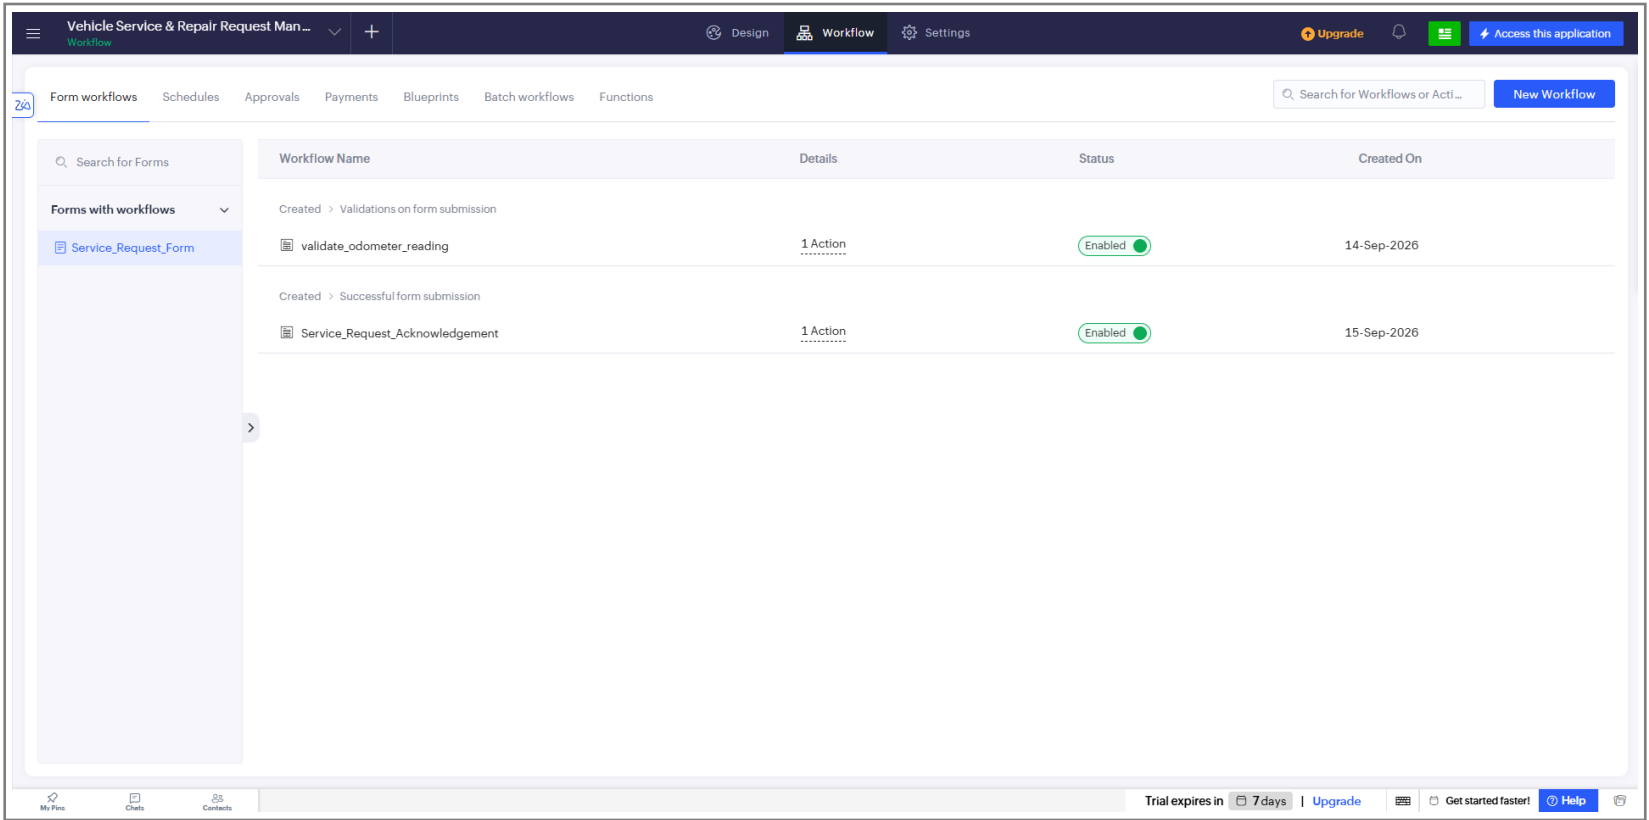

- Designed a 'Service_Request_Form' to capture owner and vehicle details.
- Created a form workflow 'validate_odometer_reading' to validate data on submission.
- Created a workflow 'Service_Request_Acknowledgement' to send a confirmation email automatically.
- Both workflows are enabled and triggered on successful form submission.

Automated Email Notification (Deluge Workflow Output)

On successful form submission, a Deluge-driven workflow automatically triggers an acknowledgement email containing the submitted owner and vehicle details.

Workflow Configuration in Zoho Creator

The 'Service_Request_Form' has two enabled workflows: one validates the odometer reading on submission, and another sends the acknowledgement email automatically.

Application Testing and Debugging

- Submitted test data through the form to verify workflow execution.
- Verified the validation workflow correctly checks the odometer reading field.
- Confirmed the acknowledgement email is generated and delivered correctly.
- Used the Zoho Creator workflow status and logs to identify and resolve execution errors.

Conclusion

- Successfully automated the vehicle service request process using Deluge and workflows.
- The experiment demonstrates how low-code platforms can streamline business processes.
- Testing and debugging confirmed the reliability of the automated workflows.
- This approach can be extended to other business process automation use cases.
