EXPERIMENT 11

DEVELOPMENT-TO-PRODUCTION DEPLOYMENT

Student Name: Divoshini V **Register Number:** 241401020

1. Aim

To study and document a controlled deployment lifecycle for the **Vehicle Service & Repair Request Management** application in Zoho Creator, including pre-release validation, release preparation, and post-deployment checks.

2. Objectives

• Understand development, testing, and production stages.
• Prepare a deployment checklist for the application.
• Identify risks involving form validation, reports, workflows, permissions, and data.
• Distinguish documented requirements from checks that still need live verification.

3. Platform and Application Context

Item	Details
Platform	Zoho Creator
Application	Vehicle Service & Repair Request Management
Form	Service_Request_Form
Report	Service_Request_Report
Primary users	Vehicle owners, service-center front office, and technicians

4. Theory

Deployment is the controlled movement of a tested application configuration to a target environment. A release should follow checks of form fields, validation rules, reports, workflows, permissions, notification settings, and data handling. The target environment and authorization must be confirmed before publishing. After release, smoke tests should verify the main user journey, and a backup or rollback plan should be available.

5. Procedure

1. Review the application components specified in the project document: Service_Request_Form and Service_Request_Report.
2. Review the 13 Basic Fields and the four form sections: Owner Details, Contact Details, Vehicle & Issue Details, and Scheduling & Authorization.
3. Prepare fictional test cases for valid submission, missing mandatory fields, invalid email/phone, non-positive odometer reading, past service date, and unchecked authorization.
4. Verify that submitted records appear in Service_Request_Report and can be filtered by Service Type and Preferred Service Date.
5. Review the acknowledgement-email workflow described in the project specification and confirm its live configuration before release.
6. Use the supported Zoho Creator publish/deployment process only after confirming the target environment and authorization.
7. After an approved release, perform smoke tests, record actual outcomes, and retain a backup/rollback plan.

EXPERIMENT 11 — DEPLOYMENT (CONTINUED)

6. Pre-release Validation and Test Plan

Test area	Test / expected behaviour	Status
Required fields	Owner_Name, Contact_Number, Vehicle_Registration_Number, Vehicle_Type, Service_Type, and authorization must be supplied.	Test case defined; live test pending
Email and phone	Invalid email and phone formats should be rejected.	Live test pending
Odometer	Odometer_Reading accepts positive numeric values only.	Live test pending
Service date	Preferred_Service_Date does not allow a past date.	Live test pending
Report	A valid submission appears in Service_Request_Report with expected values.	Live test pending
Scheduling	Records can be filtered by Service_Type and Preferred_Service_Date.	Not verified live
Acknowledgement	An acknowledgement email is sent if the described workflow is configured.	Configuration unverified
Release readiness	Target environment, authorization, backup, and rollback plan are confirmed.	Not verified

7. Observations / Test Results

Area	Observation	Status / limitation
Application scope	The project document specifies the form, report, 13 Basic Fields, validation rules, and intended acknowledgement workflow.	Requirements documented
Pre-release validation	Form, report, scheduling, and notification checks have been identified.	Live results pending
Production target	No target environment or actual release evidence was provided.	Deployment not claimed
Rollback readiness	A backup/rollback approach should be confirmed before release.	Not verified

8. Result

The deployment lifecycle and a project-specific pre-release and smoke-test checklist were documented for the application. No production deployment or successful live test is claimed because release evidence and actual test outcomes were not supplied.

9. Conclusion

A controlled deployment should validate required fields, formats, report behaviour, scheduling filters, notifications, and permissions before release. The diagram below illustrates the planned lifecycle; it is not evidence that a live deployment has been completed.
