EXPERIMENT 9

Exploring AI-assisted features and built-in analytics (Zia) in Zoho Creator

Application: Vehicle Service & Repair Request Management

Zoho Creator

1. Aim

To explore AI-assisted features available through the Zia Build Agent in Zoho Creator and examine how built-in charts, reports, and search functionality support analysis of vehicle service request data.

2. Introduction

Zoho Creator is a low-code application development platform that supports forms, reports, workflows, pages, and visual analytics. In this experiment, the Build Agent was used to request insights for the Vehicle Service & Repair Request Management application. The recommendations were reviewed and an application-menu section was organized to make the dashboard accessible.

3. Procedure

Step 1: Opened the Vehicle Service & Repair Request Management application in Zoho Creator and entered the application design environment.

Step 2: Used the Build Agent to request analysis of service request data and recommendations for useful dashboard insights.

Step 3: Reviewed the suggested analytics, including vehicle type distribution, service type analysis, service request trends, odometer patterns, additional service popularity, and scheduling insights.

Step 4: Created the *Service Request Analytics* section in the application menu and moved the existing *Service_Center_Dashboard* page into that section.

Step 5: Reviewed the dashboard elements, including the service request report, search field, service schedule, and charts.

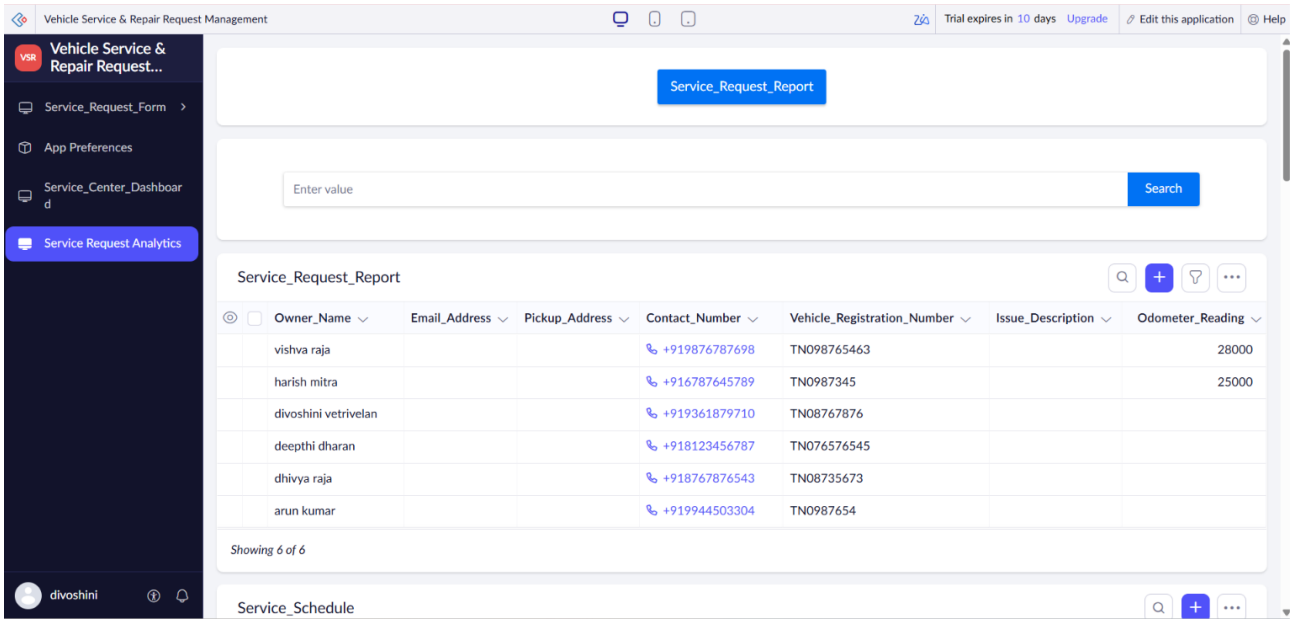

Step 6: Used sample service request records to populate the reports and charts. The *Send_Request_To_Zoho_Analytics* workflow was temporarily disabled after an unauthorized connection blocked form submission.

Step 7: Opened the analytics dashboard and verified that charts displayed data from the service request records.

4. Screenshots and Explanation

Figure 1. Service request report and application menu

The report displays six service request records and fields such as owner name, contact number, vehicle registration number, and odometer reading. The left navigation includes the Service Request Analytics section.

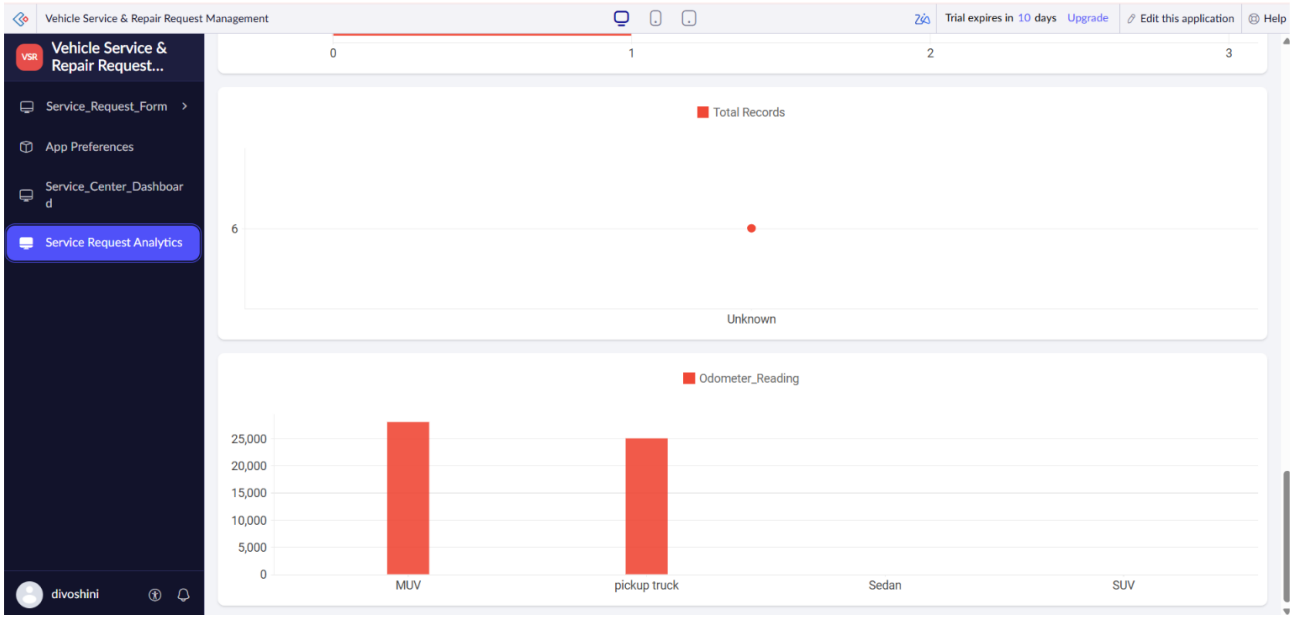

Figure 2. Vehicle type distribution and service type analysis

The pie chart compares records across vehicle types. The horizontal bar chart compares the total number of records for each service type, allowing categories to be compared visually.

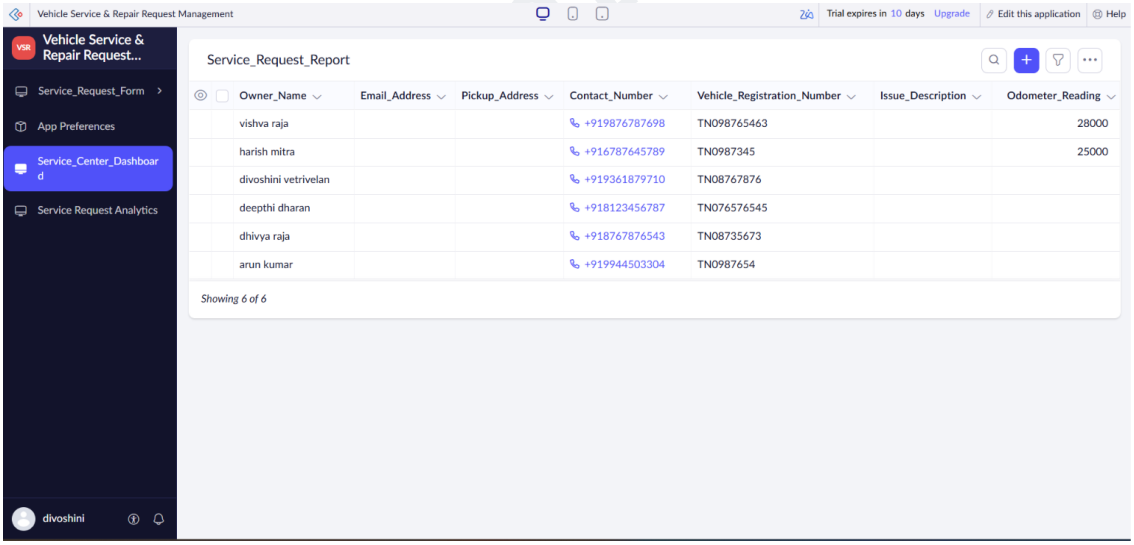

4. Screenshots and Explanation (continued)

Figure 3. Additional analytics and odometer readings

The upper chart shows one category labelled “Unknown” with six total records, which may indicate that the selected category field is blank or unavailable. The column chart displays odometer readings by vehicle type. It should be described as total readings unless its aggregation is specifically set to Average.

Figure 4. Service request report with sample records

The report lists six submitted service requests and confirms that sample records are available as the dashboard data source.

5. Observations

• The Build Agent supplied recommendations for analyzing the service request data. The recommendations served as guidance; they do not independently confirm that every proposed chart was automatically generated.

• The application menu includes the Service Request Analytics section, and the dashboard is accessible from the app.

• The dashboard includes a search field and report/calendar components alongside charts.

• Visible charts show vehicle type categories, service type counts, and odometer readings. A chart displaying “Unknown” suggests that its category field may need review.

6. Result

The AI-assisted Build Agent in Zoho Creator was explored to obtain recommendations for service request analytics. The Service Request Analytics menu section was created, the dashboard was organized and accessed successfully, and service request records were displayed in reports and charts. The experiment demonstrated how AI-generated suggestions and built-in analytics can help summarize and inspect data in a low-code application.
