

EXPERIMENT REPORT

Building Reports, Dashboards, and Custom Pages using UI Builder

Name	Divoshini V
Roll No.	241401020
Application	Vehicle Service & Repair Request Management
Experiment	Reports, Dashboards & Custom Pages (UI Builder)

Aim

To design and build a functional vehicle service and repair management interface using UI Builder, incorporating reports, dashboards, a service scheduling calendar, search/filter controls, and visual analytics to support efficient service-center operations.

Procedure

1. Open the Vehicle Service & Repair Request Management application and access the UI Builder/dashboard area.
2. Create or configure the Service Request Report to display owner name, email address, pickup address, contact number, and vehicle registration.
3. Add interactive controls such as search, filter, add, and view options to improve report usability.
4. Configure the Service Schedule component with Month, Week, and Day calendar views.
5. Add service-request records to the schedule so planned service activities are visible on the calendar.
6. Create an analytical chart using odometer-related data to compare vehicle categories visually.

7. Arrange the report, calendar, and chart components into a clear and organized dashboard.
8. Preview and verify that records, calendar entries, controls, and charts are displayed correctly.

1. Service Request Report Dashboard

The report displays service-request records with owner name, email address, pickup address, contact number, and vehicle registration information. Search, filter, and add controls improve interaction.

2. Service Schedule – Calendar View

The Service_Schedule component provides Month, Week, and Day views. Scheduled service entries are displayed on the calendar for convenient planning and tracking.

3. Odometer Reading – Analytical Chart

The dashboard contains a horizontal bar chart for Odometer_Reading, enabling comparison of recorded readings across vehicle categories such as Sedan and Hatchback.

RESULT

The Vehicle Service & Repair Request Management application was successfully designed using UI Builder. The dashboard integrates a service request report, interactive search and filter controls, a service scheduling calendar, and an odometer-reading chart. These components provide an organized and user-friendly interface for monitoring service requests, planning scheduled services, and viewing vehicle-related information.

Hence, the experiment was successfully completed and the required reports, dashboard components, and custom UI elements were built and verified.
